

AMENDMENT TO THE SPECIFICATION

Please amend the first full paragraph on page 6 of the specification as follows:

Because of the position of the mounting 18 for the loading arm 20 and other body 11 features, the superstructure 25 cannot be rotated or slewed on the body 11 ~~though~~ through a full 360°, but preferably can be rotated or slewed through up to 300°, when mechanical stops provided on a slewing ring will engage to prevent the superstructure 25 being rotated such that damage might be caused to the body 11. Instead of or in addition to mechanical stops, hydraulic interlocks might be provided to restrict rotation of the superstructure 25 beyond its design limit, e.g. a hydraulic brake may be provided for a hydraulic motor used to slew the superstructure 25.
